Copy of Public Works & Labour Department Memorandum No.4748.D-34-1 dated 1st November 1934 to the Chief Engineer for Irrigation.

Spring channel from the Hagari - Legislative Council Question.

The Chief Engineer (Irrigation) is requested to report ıether the spring channel from the Hagari river irrigating the ɜt fields of Rupanagudi village Bellary Taluk, Bellary District ɜ in imminent danger of being silted up with sand because of the ɜstiıction of the pricklypear on its bank by the introduction of ɔchineal insects, and if so whether any measures have been taken are proposed to be taken to keep the channel safe for irrigation ırposes.

Office of the Chief Engineer for Irrigation.
Endorsement No.3140/34 C.E.P. dated 1st December 1934

Read: Copy of letter No.1619 dated 23-11-1934 from the Sub Divisional Officer, Bellary Sub Division, Bellary, to the Executive Engineer, Bellary Deivision:--

Sub:- Rupanagudi - Spring channel from the Hagari Legislative Council Question.

Ref:- Your No.1068 S dated 10-11-1934 and No.1118-S dated 14.11.1934

....

The Rupanagudi Spring Channel, which is in charge of the Revenue Department, takes off from the Hagari and flows almost parallel to it for about 2½ miles, the distance between them being about 3 or 4 furlongs. A chain of sand mounds has formed between them, the nearest being about a furlong from the channel. These sand mounds can be seen at a few places on the East bank of the Hagari in this district, being formed due to sand storms over so many years. One set can be seen along the Hagari-Chintakunta Road.

Some of these mounds were covered with the prickly pear. As they all have been destroyed, the ryots say, the open sand gets blown about during sand storms and they are afraid, the mounds are likely to drift towards their channel, though it is a process that will take many years.

4147°/35

There seems to be no imminent danger, but the movement of these sand mouunds will have to be watched and some jungle growth encouraged on them also. Most probably, Casuarina plantation will solve the trouble as well as be profitable.

Copy submitted to Superintending Engineer, Madras, with reference to his No.762 By/ dated 12-11-34. The channel is not in charge of P.W.D. The Revenue Department may be asked to plant either casuarina or a creeper to prevent the sand being blown into the channel.

Irrigation - Minor - Bellary taluk - Rupanagudi villa Hagari channel - Danger of being silted up - Legislative Counc Question - report.

Board's M.1470/35.1 dated 7.3.35.

I forward herewith the report of the Tahsildar Bellary L.Dis.c.No.492/35 dated 13.3.35 (copy enclosed) showing the action taken by the Rupanagudi ryots to prevent the sand being blown into their channel. Though there is no imminent danger of the channel being affected by the shifting sands, the sand may be blown into the channel in a period of about 5 or 6 years and in order to prevent this it may be necessary to plant mill hedge plants or aloes along the sand banks as casuarina plantation is costly. The channel has an ayacut of 300.79 acres wit an assessment of Rs.2193. Particulars of extents irrigated ar the revenue derived from the channel in faslis 1341, 1342, and 1343 are noted in the margin. The channel is under the contro of the Revenue Department and its maintenance is in good condition. Some encouragement has to be given to ryots in t nitial stage to prevent the danger referred to above, since here might be loss of revenue to Government, if the channel ets silted up in course of time. This may be done by a speci rant alloted for the purpose on condition that the ayacutdars

Irrigation - Rupanagudi village - spring channel from the Hagari rover - Damages of - being silted up - planting of trees - report submitted.

Your C.No. 211/35 dated 21.1.35.

The suggestion made by the Public Works Department has already been tak... advantage of, and during the last year creepers known as "Camel foot" were planted along the sand hills. Casuarina plantation being a costly concern, the ryots could not agree to it. The ryots will gradually take to Casuarina or aloe plantation to prevent the sand from blowing into the channel. Aloes need watering in the initial stage and as such may not be easy for the ryots. But milk hedge plant being hardy, the ryots want to try it next time. The ryots have understood the danger and have found it necessary to prevent the channel from being silted up. For the present the creeper plants appear to be the cheapest of all.

Sir,

Irrigation- Bellary Taluk- Rupanagudi village- spring channel from the Hagari River- Silting up with sand- Prevention-

---

Ref. Board's No. M. 1470/35-3 dated 18-6-35.

Encl. one plan in original.

The Revenue Divisional Officer, Bellary has submitted an estimate for Rs. 750/- for the growing of milk hedge plants to prevent the spring channel from being silted up with sand. The estimate provides for the formation of two rows of milk hedge plants between the Hagari River and the sand mounds to obstruct sand drifts from the river and three rows between the sand mounds and the channel to prevent further drifts if any escaping through the two rows referred to above. Each row consists of three lines at 1 ½' apart and each hedge in a line 1½' apart as shown in the enclosed sketch. The estimate has been returned to the Tahsildar for signature and return through the Revenue Divisional Officer with his counter-signature. It will be sanctioned during the current year if approved by Government and the work taken up for execution urgently as the plants thrive well during the rainy season.

For Collector.
